

Lecture 4: Condensation

1. Condensation of corundum

We acknowledge and respect the $lək̓ʷəŋən$ peoples on whose traditional territory the university stands and the Songhees, Esquimalt and W̱SÁNEĆ peoples whose historical relationships with the land continue to this day.

Practice Problem: Condensation of Corundum from the Solar Nebula

Q1: Calculate the temperature that Corundum (Al_2O_3) begins condensing from the solar nebula using the following values (assume no other reactions):

- Solar abundance (molar abundance) of Al: 8.51×10^4
- Solar abundance (molar abundance) of O: 2.36×10^7
- Solar abundance (molar abundance) of H: 2.6×10^{10}
- Pressure in the nebula: 10^{-3} atm
- Gas constant (R): 8.314 J/mol K
- ΔG° (standard free energy of reaction) for condensation of Al_2O_3 : -1.23×10^6 J/mol

Q2: At what temperature will this reaction finish condensing all of the Aluminum in the nebula?

Condensation of corundum (ruby/sapphire)

$$Q = \frac{\{\text{Al}_2\text{O}_3\}}{\{\text{Al}\}^2 \{\text{O}\}^3} = \frac{1}{P_{\text{Al}}^2 \cdot P_{\text{O}}^3}$$

at high T , low P safe to
assume ideal gas

$$\{X\} = P_X$$

$$P_T = 10^{-3} \text{ atm}$$

assumption: $P_T = P_{\text{H}_2}$

$$\frac{P_X}{P_{\text{H}_2}} = \frac{N_X}{N_{\text{H}_2}}$$

$$N_{\text{H}_2} = \frac{1}{2} N_{\text{H}}$$

$$P_{\text{Al}} = \frac{N_{\text{Al}}}{\frac{1}{2} N_{\text{H}}} \cdot P_{\text{H}_2} = \frac{2 N_{\text{Al}}}{N_{\text{H}}} \cdot P_T$$

$$\Delta G^\circ = -RT \ln K$$

$$-\frac{\Delta G^\circ}{RT} = \ln K \quad \rightarrow \text{let :}$$

this sign corresponds to reaction direction

$$x = -\frac{1}{T} \quad y = -\ln K$$

$$x - \frac{\Delta G^\circ}{R} = y$$

Condensation of corundum (ruby/sapphire)

$$Q = \frac{\{\text{Al}_2\text{O}_3\}}{\{\text{Al}\}^2 \{\text{O}\}^3} = \frac{1}{P_{\text{Al}}^2 \cdot P_{\text{O}}^3}$$

$$\frac{-\Delta G^\circ}{RT} = \ln \frac{1}{(6.5e^{-9})^2 (1.8e^{-6})^3}$$

$$\frac{-\Delta G^\circ}{RT} = 77.3$$

*ΔG given in problem

$$\frac{-(-1.23e6)}{8.314 \cdot 77.3} = T \approx 1913 \text{ Kelvin}$$

chemistry = Sun

$$\frac{P_x}{P_{\text{H}_2}} = \frac{N_x}{N_{\text{H}_2}} \quad P_T = 10^{-3} \text{ atm}$$

assumption: $P_T = P_{\text{H}_2}$

$$N_{\text{H}_2} = \frac{1}{2} N_{\text{H}}$$

$$6.5e^{-9} = P_{\text{Al}} = \frac{N_{\text{Al}}}{\frac{1}{2} N_{\text{H}}} \cdot P_{\text{H}_2} = \frac{2 N_{\text{Al}}}{N_{\text{H}}} \cdot P_T$$

$$1.8e^{-6} = P_{\text{O}} = \frac{2 N_{\text{O}}}{N_{\text{H}}} \cdot P_T$$

Condensation of corundum (ruby/sapphire)

$$Q = \frac{\{\text{Al}_2\text{O}_3\}}{\{\text{Al}\}^2 \{\text{O}\}^3} = \frac{1}{P_{\text{Al}}^2 \cdot P_{\text{O}}^3}$$

Al is limiting $\frac{N_{\text{Al}}}{N_{\text{O}}} < \frac{2}{3}$

What is P_{Al} when all Al condensed? $\sim 0_{\text{atm}} = P_{\text{Al}} - 0.99 P_{\text{Al}}$

What is P_{O} when all Al condensed? $> 0_{\text{atm}} = P_{\text{O}} - \frac{3}{2}(0.99 P_{\text{Al}})$

$$\frac{-\Delta G^\circ}{RT} = \ln \frac{1}{(P_{\text{Al}} - 0.99 P_{\text{Al}})^2 \left(P_{\text{O}} - \frac{3}{2}(0.99 P_{\text{Al}})\right)^3}$$

$$T \approx 1710 \text{ K}$$

50 % condensation

$$\approx 1880 \text{ K}$$

$$P_{\text{Al}} = \frac{2 N_{\text{Al}}}{N_{\text{H}}} \cdot P_{\text{T}}$$

$$P_{\text{O}} = \frac{2 N_{\text{O}}}{N_{\text{H}}} \cdot P_{\text{T}}$$

... ..

Not quite as simple as our example..

Table 1. Gaseous species contributing more than 10⁻⁷ of the total moles of their common constituent element between 2000°K and 1200°K.

Element	Abundance* (Si = 10 ⁶)	Gaseous species
Hydrogen	2.6 × 10 ¹⁰	H ₂ , H, H ₂ O, HF, HCl, MgH, HS, H ₂ S, MgOH
Oxygen	2.36 × 10 ⁷	CO, SiO, H ₂ O, TiO, OH, HCO, CO ₂ , PO, CaO, COS, MgO, SiO ₂ , AlOH, SO NaOH, MgOH, PO ₂ , Mg(OH) ₂ , AlO ₂ H
Carbon	1.35 × 10 ⁷	CO, HCN, CS, HCO, CO ₂ , COS, HCP
Nitrogen	2.44 × 10 ⁶	N ₂ , HCN, PN, NH ₃ , NH ₂
Magnesium	1.05 × 10 ⁶	Mg, MgH, MgS, MgF, MgCl, MgO, MgOH, Mg(OH) ₂
Silicon	1.00 × 10 ⁶	Si, SiS, SiO, SiO ₂
Iron	8.90 × 10 ⁵	Fe
Sulfur	5.06 × 10 ⁵	SiS, CS, S, HS, H ₂ S, PS, AlS, MgS, NS, S ₂ , COS, SO, CS ₂ , SO ₂
Aluminum	8.51 × 10 ⁴	Al, AlH, AlF, AlCl, AlS, AlO, Al ₂ O, AlOH, AlOF, AlO ₂ H
Calcium	7.36 × 10 ⁴	Ca, CaF, CaO, CaCl ₂
Sodium	6.32 × 10 ⁴	Na, NaH, NaCl, NaF, NaOH
Nickel	4.57 × 10 ⁴	Ni
Phosphorus	1.27 × 10 ⁴	P, PN, PH, P ₂ , PH ₃ , PS, PO, PH ₂ , PO ₂ , HCP
Chromium	1.24 × 10 ⁴	Cr
Manganese	8800	Mn
Fluorine	3630	HF, AlF, CaF, F, MgF, NaF, NF, KF, PF, CaF ₂ , AlOF, TiF ₂ , MgF ₂ , MgClF, TiF
Potassium	3240	K, KH, KCl, KF, KOH
Titanium	2300	Ti, TiO, TiF ₃ , TiO ₂ , TiF
Cobalt	2300	Co
Chlorine	1970	HCl, Cl, AlCl, NaCl, KCl, MgCl, CaCl ₂ , MgCl ₂ , AlOCl, MgClF

Forming the planets

Olivine Solid Solution Phase Diagram.

Lever Rule:
(mass balance)

unknown fraction

$$a \cdot L + b \cdot S = \text{System}$$
$$a + b = 1 \quad \text{mass balance}$$
$$b = 1 - a$$
$$aL + (1-a)S = \text{system}$$
$$a \cdot 0.25 + (1-a) \cdot 0.8 = 0.7$$
